## Sequential Execution of Instructions

(0) Every command should be executed in order in which it is listed in the program.
© That is called sequential execution of the program.

## Data Representation:

## STORING INFORMATION IN A COMPUTER

Computers are used to store different types of information including

- numbers $1,45,7.3$
- graphics

- sound
- characters hello, total, $4 R$

These are stored using on and off pulses of electricity.

These on and off pulses are the computers own language called Machine Code.

The on and off pulses are easily represented by $\mathbf{1}$ and $\mathbf{0}$ which are called binary digits or bits. 0 and 1 are called binary digits or bits.

## Integers - Positive numbers

Numbers are stored using 8 binary digits.

| Decimal number | Binary number |
| :---: | :---: |
| 0 | 00000000 |
| 1 | 00000001 |
| 2 | 00000010 |
| 3 | 00000011 |
| 4 | 00000100 |
| 5 | 00000101 |
| 6 | 00000110 |
| 7 | 00000111 |
| 8 | 00001000 |

A binary number should be written using 8 bits.

## Understanding binary numbers

In everyday life 10 decimal numbers are used.

|  | 10000 | 1000 | $100 \quad 10$ | 1 |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 42678 can be seen as : | 4 | 2 | 6 | Binary works 7 | 8 |
| in a similar way. |  |  |  |  |  |

|  |  | 16 |  | 8 | $\mathbf{4}$ | $\mathbf{2}$ | $\mathbf{1}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 11001 can be seen as : | 1 | 1 | 0 | 0 |  |  | 1 |

The base of binary number system is 2 .

## Changing Decimal numbers to Binary

84 becomes: $84-64=2200$|  | 0 | 1 | 0 | 1 | 0 | 1 | 0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | 0

$$
\begin{gathered}
20-16=4 \\
4-4=0
\end{gathered}
$$

The base of decimal number system is 10.

| Character | ASCII Code |
| :--- | :--- |
| A | 01000001 |
| a | 01100001 |
| $\%$ | 10010100 |

## Changing Decimal numbers to Binary

| 86 becomes | 128 | 64 | 32 | 16 | 8 | 4 | 2 | 1 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $86-64=22$ | 0 | 1 | 0 | 1 | 0 | 1 | 1 | 0 |
| $22-16=6$ |  |  |  |  |  |  |  |  |
| $6-4=2$ |  |  |  |  |  |  |  |  |
| $2-2=0$ |  |  |  |  |  |  |  |  |
| $2-2$ |  |  |  |  |  |  |  |  |

86 converted into binary is 01010110

A binary number should be written using 8 bits.

## Text

- text is a symbol or letter on the keyboard.
- text can be represented using ASCII, American Standard Code for Information

Interchange. ASCII uses 8 bits per character, giving a possible 256 different characters

- ASCII uses 8 bits to represent each character
